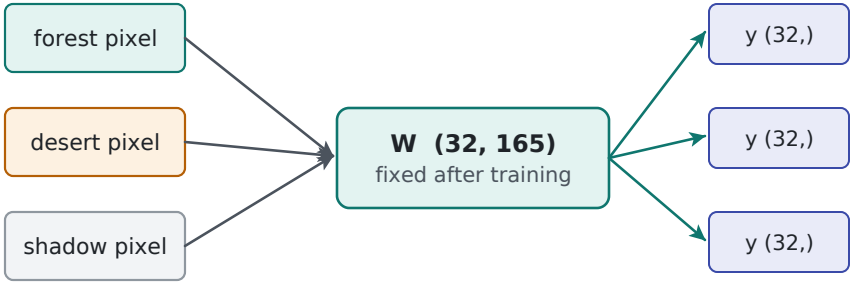
a The same W mixes every pixel



Training chooses W once; no pixel can change it.

b A dead band filled with 0.0 is mixed in anyway

x =	1.2	1.0	-0.4	-0.6
x_broken =	1.2	1.0	0.0	-0.6
W row 1 =	0	0	0.5	0.5

true y1 = 0.5 x (-0.4) + 0.5 x (-0.6) = -0.50

broken y1 = 0.5 x 0.0 + 0.5 x (-0.6) = -0.30

one bad band moves the output by 0.20 (40%)

Three limits follow: no per-pixel adaptation, no way to skip a band, and a weight per band position (only 165 bands).
