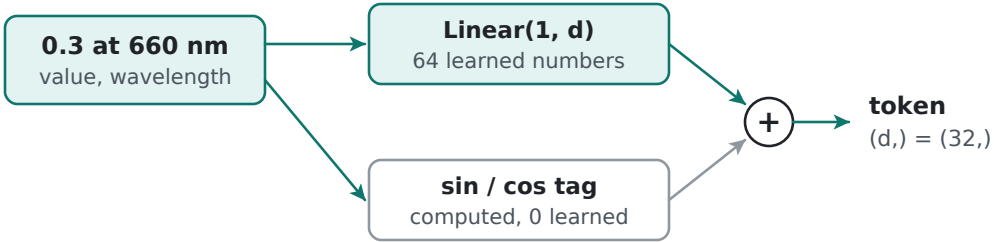
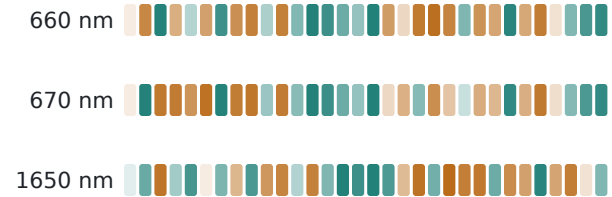
a One band of one pixel



d = 2 example (part 33): value part [0.25, -0.10] + period-1000 tag [-0.8443, -0.5358] = token [-0.5943, -0.6358]

b The 32-number tag, real formula



cosine similarity: 660 vs 670 = 0.671; 660 vs 1650 = 0.013

positive negative (shade = size)

The tag makes "0.21 at 864 nm" mean the same thing on every sensor; a band index would tie the model to one band list.
