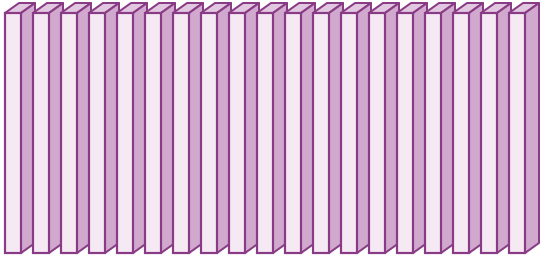
a Per-band stem: ~19 tensors of shape (16,384 pixels, 202 bands, 32), bf16



one tensor:

16,384 x 202 x 32 x 2 bytes
= 211,812,352 bytes = 202 MiB

19 x 202 MiB = 3,838 MiB = 3.75 GiB per patch

(measured: about 3.7 GiB per 128 x 128 patch)

b Reduced stem (part 40)

largest per-pixel tensor (P, 53, 32):
16,384 x 53 x 32 x 2 = 53 MiB

Inference keeps none of these; training keeps all.

Slab height drawn in proportion to the band axis (202 against 53). Part 40 has the measured throughput table.
