
Each pixel's recipe is W . diag(g): today's W with its columns rescaled by that pixel's own faders.

Worked (part 10's pixel): z = [-2, -2, 2, 2] gives g = [0.12, 0.12, 0.88, 0.88], and y0 falls from 1.1 to 0.132.

Sigmoid never reaches 0: a dead band holding 99 with z = -5 still leaks 0.0067 x 99 = 0.66 into the mix.

Cost per pixel: 12,928 for the gate + 6,464 for W = 19,392 multiply-adds, three times today's compressor.
