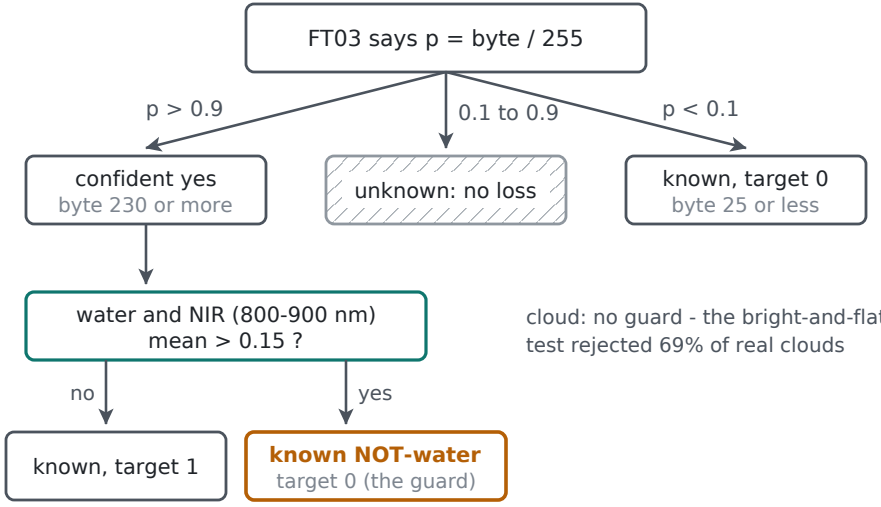
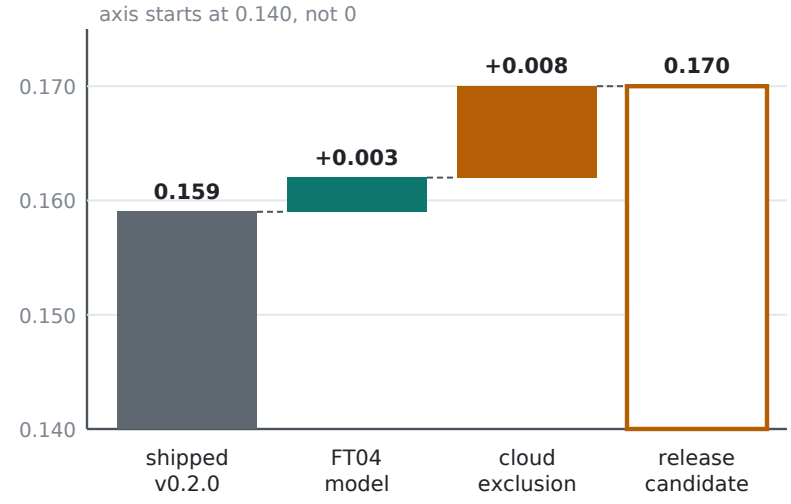
(a) one teacher probability -> one FT04 target (water and cloud only)



cloud: no guard - the bright-and-flat test rejected 69% of real clouds

thin cloud, shadow, snow: always unknown here (EnMAP's labels teach them); so is any pixel with under 90% of its bands finite

(b) real PRISMA bench, pAUC to 1% false alarms



exclusion is 0.008 of the 0.011 gain (73%);
v0.2.0 + cloud exclusion was not run on this bench
